

South Dakota Seed Blower

**SAVES TIME . . .
REDUCES TESTING AND DOCKAGE COSTS**

90% or more time can be saved in purity testing and in docking and cleaning seed and grain samples, by using the South Dakota Seed Blower. It makes separations of seed and lightweight materials quickly ($\frac{1}{2}$ min.) and easily in determining the dockage in a seed lot. Seed and grain samples can also be classified as to quality, based on weight and size.

The separation is made by accurately controlling the flow of air upward through the column. The column is made of transparent plastic so that the operation can be watched and any desired result obtained. A precision valve at the top of the column can be adjusted to control the air flow. A humidifier is provided at the intake to reduce trouble from charges of static electricity on the column or on the dry particles.
